Remarketing Pillar Page (gated)	4
Remarketing Funnel → Lead Magnet → Blog → Text/SMS → Content Marketing	5
5. Cross-cutting wiring rules (apply to every asset above)	5

Asset Wiring — Names, Order, and How Each Connects to the Model

This document lists every content asset in the pipeline, the exact order they run in, and how each one is wired into the Claude API call — what context it reads, what it writes, and what depends on it.

1. Phase 1 — primary asset chain

This is the main sequence. Assets run in this order; each one after Pillar Page reads from everything approved before it.

Order	stage_type	Asset name	Gated?
1	icp	ICP	Yes
2	cro	CRO	Yes
3	pillar_page	Pillar Page	Yes
4	funnel	Funnel	No
5	offers	Offers	No
6	lead_magnet	Lead Magnet	No
7	blog	Blog	No
8	text_sms	Text/SMS	No
9	seo_pillar_page	SEO-focused Pillar Page	No
10	plan_of_action	Plan of Action	No
11	content_marketing	Content Marketing	No
12	social_content_strategy	Social Content Strategy	No
13	webinar_competitor	Webinars (competitor-sourced)	No
14	webinar_llm	Webinars (LLM-sourced)	No
15	book	Book	No
16	podcast	Podcast	No

Only the first three are gated — everything from Funnel onward auto-chains once Pillar Page is approved, per the earlier gating decision.

2. Phase 2 — Remarketing sub-service

Runs as its own parallel track. Does not block Phase 1, but its first stage depends on Phase 1's ICP and CRO output.

Order	stage_type	Asset name	Gated?
1	remarketing_pillar_page	Pillar page	Yes
2	remarketing_funnel	Funnel	No
3	remarketing_lead_magnet	Lead Magnet	No
4	remarketing_blog	Blog	No
5	remarketing_text_sms	Text/SMS	No
6	remarketing_content_marketing	Content Marketing	No

3. How each asset is wired into the model

Every asset follows the same mechanical pattern: **fetch context** → **render template** → **call Claude** → **parse output** → **write context**. What differs per asset is which context fields it reads and which new fields it writes. This mirrors exactly how the original master prompts worked when run manually in one long chat — the only change is that “read from earlier in this chat” becomes “read named fields from context_entries.”

Stage 1 — ICP

- **Reads:** operator-entered intake only (company name, industry, region, service focus, competitor URLs if known). No prior context exists yet — this is the first stage.
- **Prompt behavior:** structured intake block at the top (company/industry/awareness-level/region/B2B-or-B2C fields), followed by the locked master prompt body. This matches the original ICP prompt’s own “— INPUTS — / — END OF INPUTS —” format.
- **Claude call:** single call, no attachments needed beyond the intake fields.
- **Output parsed into:** a named buyer persona — demographics, psychographics, pain points, objections, awareness stage.
- **Writes to context_entries:** icp_persona_name, icp_pain_points, icp_demographics, icp_psychographics, icp_objections, icp_awareness_stage.
- **Unlocks:** CRO (Stage 2).

Stage 2 — CRO

- **Reads:** all icp_* fields from Stage 1, plus a separately supplied Competitor Analysis document and a CRO Framework reference document.
- **Prompt behavior:** this is the “three-document input system” from the original prompt — ICP, Competitor Analysis, and CRO Framework are all treated as live inputs rather than baked into the template, so the same prompt template works for any project. The existing landing page copy is pasted in as the subject of the audit.
- **Claude call:** single call. Because this prompt combines three source documents plus the existing page copy, it is the largest single input in the whole chain — this is the one stage worth watching for context-length limits as projects scale.
- **Output parsed into two parts**, matching the original prompt’s own two-part output rule:

1. **CRO audit report** — a structured critique of the current page against the CRO framework’s persuasion model.
 2. **Rewritten pillar page copy** — full page text, organized into the site’s 12-section architecture, with certain sections explicitly marked **locked** (treatment/process/pricing names that must not be renamed or reworded — only expanded around).
- **Writes to context_entries:** `cro_audit_findings`, `cro_rewritten_copy` (full text, section-tagged), `cro_locked_sections` (the list of section names/content that later stages must never alter).
 - **Unlocks:** Pillar Page (Stage 3).

Stage 3 — Pillar Page

- **Reads:** `cro_rewritten_copy` and `cro_locked_sections` from Stage 2, plus a reference screenshot or URL of an existing branded page (site design system: colors, buttons, typography, layout).
- **Prompt behavior:** matches the original “Designing Page” prompt exactly — explicit instruction to follow the existing design system precisely and never invent new visual design. It also inherits the locked-content rule: the design pass is not allowed to alter wording in the sections Stage 2 marked locked, only lay them out.
- **Claude call:** single call. Output is HTML/CSS (or a structured design brief, depending on how the design system was supplied).
- **Writes to context_entries:** `design_tokens` (colors, fonts, button styles extracted from the reference), `pillar_page_html`.
- **Unlocks:** everything in Phase 1 from Funnel onward, and Phase 2’s Remarketing Pillar Page.
- **This is the last gated stage** — from here on, stages auto-chain.

Stage 4 — Funnel

- **Reads:** `icp_*` fields, `cro_rewritten_copy`, `design_tokens`.
- **Prompt behavior:** builds the full funnel architecture (landing → thank-you → follow-up sequence) using the same ICP and CRO foundation, per the original prompt pattern of extending a prior report into a new one rather than starting fresh.
- **Writes to context_entries:** `funnel_stages`, `funnel_cta_map`.

Stage 5 — Offers

- **Reads:** `icp_pain_points`, `funnel_stages`.
- **Writes to context_entries:** `offer_ladder` (the value-ladder tiers referenced by later downstream content).

Stage 6 — Lead Magnet

- **Reads:** `icp_*`, `offer_ladder`.
- **Writes to context_entries:** `lead_magnet_type`, `lead_magnet_copy`.

Stage 7 — Blog

- **Reads:** `icp_*`, `cro_rewritten_copy` (for voice/tone consistency), plus a keyword/SERP-gap check performed as an internal step before writing, matching the original Blogs prompt’s own pattern.
- **Writes to context_entries:** `blog_posts` (list, since this asset can produce multiple posts over time).

Stage 8 — Text/SMS

- **Reads:** `icp_*`, `funnel_stages`.

- **Writes to context_entries:** sms_sequence.

Stage 9 — SEO-focused Pillar Page

- **Reads:** cro_rewritten_copy, design_tokens — a variant pass focused on organic search rather than paid.
- **Writes to context_entries:** seo_pillar_page_copy.

Stage 10 — Plan of Action

- **Reads:** every context_entries field written so far in Phase 1 — this stage is a synthesis step, not a new content type.
- **Writes to context_entries:** plan_of_action_summary. Also produces the two HTML visual outputs (asset mindmap, plan-of-action tree) referenced in the original tracker.

Stage 11 — Content Marketing

- **Reads:** icp_*, blog_posts, offer_ladder.
- **Writes to context_entries:** content_marketing_strategy.

Stage 12 — Social Content Strategy

- **Reads:** icp_*, content_marketing_strategy.
- **Writes to context_entries:** social_strategy.

Stage 13 — Webinars (competitor-sourced)

- **Reads:** icp_*, plus a separately supplied competitor webinar transcript (external document, not generated by the pipeline).
- **Writes to context_entries:** webinar_competitor_findings.

Stage 14 — Webinars (LLM-sourced)

- **Reads:** icp_*, webinar_competitor_findings (builds on the competitor pass rather than duplicating it).
- **Writes to context_entries:** webinar_script.

Stage 15 — Book

- **Reads:** icp_*, content_marketing_strategy, plan_of_action_summary — long-form synthesis of everything established so far.
- **Writes to context_entries:** book_outline.

Stage 16 — Podcast

- **Reads:** icp_*, webinar_script, plus a separately supplied podcast transcript source (external document).
- **Writes to context_entries:** podcast_intelligence, podcast_ad_copy_notes.

4. Phase 2 wiring (Remarketing track)

Phase 2's first stage is the only place the two phases connect. Everything after it stays inside Phase 2.

Remarketing Pillar Page (gated)

- **Reads:** icp_* and cro_rewritten_copy from **Phase 1**, plus design_tokens from Phase 1's Pillar Page stage — reused rather than regenerated, since brand design doesn't change between service lines.

- **Writes to context_entries:** remarketing_pillar_page_copy (scoped to the Remarketing project/track).

Remarketing Funnel → Lead Magnet → Blog → Text/SMS → Content Marketing

- Same read/write pattern as their Phase 1 counterparts (Stages 4, 6, 7, 8, 11 above), but reading remarketing_pillar_page_copy instead of the Phase 1 Pillar Page output, and writing to their own remarketing_* context keys so the two tracks never overwrite each other's data.
-

5. Cross-cutting wiring rules (apply to every asset above)

- **Locked content propagates.** Any section CRO marks as locked in Stage 2 stays locked through every later stage that touches page copy (Pillar Page, SEO Pillar Page, Funnel). This is enforced at the prompt level — every downstream template includes the locked-sections list as a hard constraint, not just Stage 3.
- **Context keys are additive, never overwritten.** Once a field like icp_pain_points is written, later stages only read it — nothing after Stage 1 can silently change what the ICP said. If the ICP itself needs revising, that means re-running Stage 1, which cascades a re-approval requirement down the chain.
- **External source documents are separate from generated context.** Competitor Analysis, CRO Framework, competitor webinar transcripts, and podcast transcripts are supplied inputs, not pipeline outputs — they're attached to the relevant stage's Claude call but never generated or altered by the system itself.
- **Every stage call is a single, stateless request.** No stage relies on Claude "remembering" earlier stages through conversation history — every fact it needs is explicitly pulled from context_entries and included in that stage's own prompt. This is the one deliberate structural change from how the process worked manually (one long chat thread) to how it works in the automated system.
